Hiring Team
Affirm

Dear Hiring Team,

I am writing to apply for the Backend Software Engineer role at Affirm. With over two years of experience designing and launching distributed microservices at Verisk Analytics, and hands-on proficiency in Python, AWS, MySQL, and Kubernetes, I am excited by the opportunity to contribute to financial infrastructure that genuinely improves people's lives.

At Verisk, I have built and owned backend systems end-to-end — from architecting an AWS SQS-based distributed microservice that reduced client wait time by 83%, to engineering async data pipelines with idempotent retry logic that eliminated message loss across high-throughput workflows. Serving over 200,000 weekly requests through well-structured REST APIs, I have consistently focused on writing clean, testable, and extensible code that my team can confidently build on. I take code reviews seriously as a tool for raising shared quality standards, and I have directly led review cycles that cut regressions and improved consistency across the codebase.

What draws me specifically to Affirm is the scale and complexity of the engineering challenges involved in powering a global payments and lending platform. Designing systems that are both highly reliable and fair to consumers demands exactly the kind of distributed systems thinking, careful ownership, and collaborative engineering culture that I have worked hard to develop. My experience with AWS (S3, SNS, SQS, EKS, Lambda), Kubernetes, MySQL, Kafka, and Redis gives me a strong foundation to contribute quickly, while my Python background means I can work fluently in your primary language stack from day one.

I am genuinely energised by the idea of building systems at Affirm's scale — where the correctness and reliability of a backend decision has a real, direct impact on customers. I would welcome the chance to discuss how my experience aligns with your team's needs.

Thank you for your time and consideration.

Sincerely,

Sanskar Jain
