Summary

Backend engineer with 2+ years of experience at Verisk Analytics building scalable, fault-tolerant distributed systems in **C#/.NET 8**, grounded in strong algorithms, data structures, and system design fundamentals. Skilled at reasoning through consistency, availability, and latency trade-offs when designing microservices and event-driven pipelines on **AWS**. Track record of shipping production systems end-to-end with measurable gains in scalability, reliability, and performance.

Skills

Languages: C#, Java, Python
CS Fundamentals: Algorithms, Data Structures, System Design, Concurrency, Fault Tolerance, Scalability
Backend & Architecture: Microservices, Event-Driven Systems, REST APIs, Kafka, AWS SQS, CQRS, API Versioning
Cloud: AWS (EKS, ECS, Lambda, S3, SNS, SQS, ElastiCache), Docker, Kubernetes, Terraform, CI/CD
Databases: PostgreSQL, MySQL, MongoDB, Redis, Schema Design, Query Optimisation, Indexing
Observability & Tools: OpenTelemetry, Splunk, Swagger/OpenAPI, xUnit/NUnit, Azure DevOps, Jira

Experience

Verisk Analytics Jan 2024 – Present
Software Engineer II, Hyderabad, India

- Co-designed and built **RulesRunner**, a fault-tolerant backend service in **C#/.NET 8** using **CQRS** and **AWS SQS** to decouple compliance checks from clients, cutting response latency from **3000ms to 500ms (83%)** while scaling horizontally under load.
- Engineered event-driven pipelines with **Kafka** and **AWS SNS**, adding idempotent message handling, retry/backoff strategies, and dead-letter queues that eliminated message loss during partial failures.
- Designed system architecture and API contracts for **ASP.NET Core** services handling **200K+ weekly requests**, weighing consistency, availability, and latency trade-offs across service boundaries.
- Built a resilient backend for **Xactimate's** import/export of **30+ data types** using async **Lambda** pipelines and **S3** presigned URLs, cutting transfer time **38%** and defects **25%**.
- Ran services on **AWS EKS/ECS** with **Docker** and **Kubernetes**, enabling rolling, zero-downtime releases and automatic failover across replicas.
- Optimised **PostgreSQL**/**MongoDB** schema design, indexing, and query plans, and introduced **Redis** caching on hot paths, lifting API response time **34%**.
- Authored idempotent, production-safe migration scripts for zero-downtime schema changes across live clusters under concurrent traffic.
- Instrumented services with **OpenTelemetry** tracing and **Splunk** dashboards, shrinking mean time to detect production incidents.
- Secured cross-service calls behind **Kong Gateway** using **OAuth 2.0** and **Okta**-issued **JWT** tokens without disrupting live traffic.
- Reworked **Azure DevOps** CI/CD pipelines with staged gates and parallel jobs, shrinking deployment time **50%** and build cycles **33%**.
- Cut technical debt **55%** and lifted runtime performance **30%** by migrating legacy services onto modern async patterns.

Projects

Expense Tracker – Fault-Tolerant Microservices Application Aug 2023 – Dec 2023

- Built an expense tracker with **5+ microservices** in **Spring Boot**, using async **Kafka** messaging and **Kong API Gateway** for routing and auth.
- Containerised services with **Docker**, orchestrated via **Kubernetes**, and load-tested **1000+** simulated transactions end-to-end.

Certifications

AWS Certified Cloud Practitioner Amazon Web Services — Oct 2024

Education

B.Tech in Computer Engineering – Vishwakarma Institute of Technology, Pune 2024 — CGPA: 8.8
Relevant Coursework: Data Structures & Algorithms, System Design, Operating Systems, Distributed Systems
