Sanskar Jain

Pune, Maharashtra, India | 9021620156 | sanskarjain0901@gmail.com | LinkedIn

Summary

Backend Engineer with 2+ years building cloud-native distributed systems, Kubernetes controllers, and high-throughput microservices. Proficient in Go and C#, with hands-on experience authoring CRDs, reconciliation loops, and event-driven pipelines in production. Adept at debugging complex Kubernetes workloads, shipping clean maintainable code, and rapidly learning deep systems internals.

Skills

Languages: Go, C#, Java, Python, C++
Kubernetes & Containers: Kubernetes (controllers, operators, CRDs, pods, deployments, RBAC), Docker, Helm, kubectl, kind
Cloud & DevOps: AWS (S3, SNS, Lambda), Azure DevOps, CI/CD, Terraform, AWS CDK, GitHub Actions
Backend: RESTful APIs, Microservices, gRPC, Kafka, ASP.NET Core, Spring Boot
Databases & Tools: MongoDB, PostgreSQL, etcd, Splunk, Swagger, Jira, Bitbucket

Experience

Verisk Analytics Jan 2024 – Present
Backend Engineer Hyderabad, India

- Designed and implemented Kubernetes controllers and CRDs in Go to model storage import/export workflows for Xactimate's 30+ data types, reducing data transfer latency by 40% and cutting user-reported issues by 25%.
- Authored reconciliation logic handling pod restarts, partial failures, and concurrent state updates; leveraged controller-runtime status subresource and event recording patterns for robust operator lifecycle management.
- Debugged Kubernetes workloads end-to-end — from pod scheduling and CrashLoopBackOff analysis to application-level service failures — using kubectl, Splunk logs, and distributed tracing.
- Built cloud-native REST APIs and event-driven services with AWS SNS, Lambda, and S3 for asynchronous high-volume processing, improving average response time by 35% across 200K+ weekly requests.
- Engineered CI/CD pipelines with Azure DevOps for Kubernetes-managed environments, cutting deployment time by 50% and automating integration tests, lint, and container image builds on every PR.
- Led migration of legacy services to Go and .NET 8 microservices, reducing technical debt by 60% and improving runtime performance by 30%; mentored 2–3 junior engineers on cloud-first design and Kubernetes best practices.

Projects

Kubernetes Storage Operator (Go) Jan 2024 – Mar 2024

- Built a custom Kubernetes operator in Go using `controller-runtime` to manage storage volume lifecycle via CRDs; implemented full reconciliation loops with status subresource updates, finalizers, and owner references.
- Deployed on a local `kind` cluster with GitHub Actions CI; automated unit and integration tests reduced manual validation by 60%.

Distributed Expense Tracker – Microservices Aug 2023 – Dec 2023

- Designed 5+ Java Spring Boot microservices handling 1,000+ concurrent transactions using Kafka for async inter-service communication and Kong API Gateway for centralized routing and authentication.
- Containerized all services with Docker and authored Kubernetes manifests for orchestration across dev and staging environments, cutting environment setup time by 60%.

Education

Bachelor of Technology in Computer Engineering
Vishwakarma Institute of Technology, Pune (S.P.P.U) 2024 | 8.8 GPA
