Sanskar Jain

Backend Engineer | Distributed Systems | Async Processing
Pune, Maharashtra, India | 9021620156 | sanskarjain0901@gmail.com | LinkedIn

Summary

Backend Engineer with 2+ years of experience building distributed backend systems, asynchronous workflows, AI-powered internal agents, and production APIs for high-volume platforms. Strong foundation in system design, event-driven architecture, and reliability-focused engineering across microservices, cloud storage, and queue-backed processing. Hands-on with relational and document databases, Kafka, SQS, RabbitMQ-style messaging and end-to-end feature delivery in collaborative, high-ownership teams. Comfortable working across backend design, API development, async orchestration, and delivery of production features with a small team.

Key Skills

Backend & Architecture: System design, distributed systems, microservices, REST APIs, event-driven architecture, asynchronous processing, real-time workflows
Queues & Cloud: Kafka, Amazon SQS, RabbitMQ, AWS SNS, AWS Lambda, AWS S3, Azure DevOps, CI/CD, Terraform, AWS CDK, Kubernetes, Docker
Languages & Frameworks: C#, Java, Python, TypeScript, .NET 8, ASP.NET Core, Spring Boot
Data & Observability: MongoDB, PostgreSQL, MySQL, Swagger, Postman, Splunk, Jira, Bitbucket

Experience

Verisk Analytics Jan 2024 – Present
Backend Engineer Hyderabad, India

- Engineered a scalable backend for Xactimate import/export workflows across 30+ data types using asynchronous processing, AWS S3 presigned URLs, and MongoDB, reducing transfer time by 40% and cutting user-reported issues by 25%.
- Designed and shipped cloud-native REST APIs and microservices for high-volume workflows, improving average response time by 35% while supporting 200K+ weekly requests with stronger reliability, clearer contracts, and easier downstream integration.
- Built event-driven processing paths with AWS SNS, SQS, RabbitMQ-style queues, Lambda, and S3 to coordinate background jobs, retries, and decoupled service communication, improving throughput and operational resilience.
- Developed internal workflow agents including Jira ticket creation and automation flows, integrating backend services, validation rules, and business logic to reduce manual operational effort and speed up execution across teams.
- Led migration of legacy services to .NET 8, reducing technical debt by 60% and improving runtime performance by 30% through cleaner service boundaries, modernization of APIs, and more maintainable backend patterns.
- Improved CI/CD pipelines in Azure DevOps with stronger build automation and deployment workflows, cutting deployment time by 50% and making releases faster and more reliable for backend services.

Projects

Expense Tracker – Distributed Microservices Application Aug 2023 – Dec 2023
Spring Boot, Kafka, Docker, Kong, PostgreSQL

- Built a full-stack expense platform with 5+ Spring Boot microservices handling 1,000+ simulated transactions and asynchronous inter-service communication through Apache Kafka.
- Implemented API gateway routing, service containerization, and database-backed workflows to improve scalability, fault isolation, and local setup speed by 60%.

Internal Workflow Automation Agents Dec 2025 – Mar 2026
Python, APIs, Jira, Async Processing

- Built internal agents for workflow automation including Jira ticket creation and task routing, reducing repetitive manual coordination and improving turnaround for operational requests.
- Connected agent flows with backend services and business rules to validate inputs, trigger downstream actions, and keep automations reliable for day-to-day team usage.

Education

Bachelor of Technology in Computer Engineering
Vishwakarma Institute of Technology, Pune (S.P.P.U) 2024 | 8.8 GPA
