Sanskar Jain

Level 2 Backend Engineer | API-First Microservices | Agentic Systems
Pune, Maharashtra, India | 9021620156 | sanskarjain0901@gmail.com | LinkedIn

Summary

Software Engineer with 2+ years of experience building secure, API-first backend systems and microservices in agile environments. Delivered modernization initiatives by decomposing legacy workflows into reusable services with measurable gains in performance, quality, and release velocity. Hands-on with event-driven architecture (Kafka, CDC, JSON/XML), cloud-native delivery (AWS, Docker, Kubernetes), and CI/CD automation. Passionate about agentic systems, intelligent workflow automation, and quality-first engineering aligned with long-term platform architecture.

Key Skills

Languages: Python, Java, Node.js, C#, TypeScript
Backend & APIs: REST APIs, ASP.NET Core, Spring Boot, Express.js, Microservices, API versioning, secure service design
Eventing & Data: Apache Kafka, CDC patterns, asynchronous messaging, JSON, XML, SQL (PostgreSQL/MySQL), NoSQL (MongoDB)
Cloud & DevOps: AWS (S3, SNS, Lambda), Docker, Kubernetes, Git, Azure DevOps, CI/CD, observability (logs/metrics/traces), Splunk
Modernization & Workflow: Monolith decomposition, reusable component design, workflow automation, agentic decision flows, Agile/Scrum
Nice to Have Exposure: FinTech/payments workflows, Siebel CRM integrations, React basics

Experience

Verisk Analytics Jan 2024 – Present
Software Engineer – Backend & Integration Hyderabad, India

- Built and maintained secure API and microservice solutions for import/export workflows across 30+ data entities, improving throughput by 40% and reducing user-reported defects by 25% through resilient backend design.
- Collaborated with senior engineers to decompose tightly coupled services into reusable, composable components, cutting technical debt by 60% and improving maintainability and onboarding speed across teams.
- Implemented event-driven integrations using Kafka-style asynchronous patterns, CDC-based change propagation, and JSON/XML payload contracts to enable real-time processing and reliable inter-service communication.
- Developed intelligent workflow features for automated validation, routing, and exception handling, reducing manual processing effort by 30% while improving SLA adherence for critical business flows.
- Contributed across the SDLC (design, coding, testing, deployment, monitoring) and partnered with Product, QA, and DevOps to deliver incremental releases with measurable outcomes in agile sprints.
- Enhanced CI/CD and observability by automating build-test-deploy stages, introducing quality gates, and improving logs/metrics dashboards, decreasing deployment time by 50% and accelerating incident triage.

Projects

Agentic Workflow Orchestration Platform Aug 2023 – Dec 2023
Python, Node.js, Kafka, Docker, Kubernetes

- Designed an automation platform that orchestrated API-driven decision flows for approval and exception management, enabling reusable workflow components adopted by multiple internal teams.
- Built real-time event consumers and rule engines for intelligent routing and downstream actions, increasing process completion speed by 35% and reducing manual handoffs.

Payments Event Pipeline Prototype Apr 2023 – Jul 2023
Java, Spring Boot, PostgreSQL, CDC, React

- Implemented a FinTech-style transaction pipeline using CDC and event streaming to synchronize payment state changes across services with audit-friendly traceability.
- Developed API integrations with enterprise systems (including CRM connectors such as Siebel patterns) and a lightweight React dashboard for operational visibility.

Education

Bachelor of Technology in Computer Engineering
Vishwakarma Institute of Technology, Pune (S.P.P.U) 2024 | 8.8 GPA
